Talking Points for the KD5FMU Github Repositories

Internet Monitor for AllStarLink ASL3+

https://github.com/KD5FMU/Internet-Monitor-ASL3

- **Internet-Monitor-ASL3** is a lightweight shell-based monitoring tool designed for AllStarLink version 3 nodes.
- It periodically checks for internet connectivity and provides **automatic recovery actions** if the connection is lost.
- When a failure is detected, the node can **announce a local audio alert**, attempt to **restore connectivity**, and then confirm when the connection is re-established. (Ecosystem Repos)

In short:

- A simple, automated watchdog that helps keep an AllStarLink node online and audible about its network status.

Check Connection Script File for AllStarLink Version 3

https://github.com/KD5FMU/Check-Connection-Script-File

- **Check-Connection-Script-File** is a simple shell script for AllStarLink Version 3 that monitors a node's connection status to one or more target nodes.
- If a connection is lost, the script automatically issues commands to **reconnect the node**, helping maintain persistent links. (GitHub)
- It is designed to run on a schedule (via cron), providing **continuous connection verification and automatic recovery** with minimal user intervention. (GitHub)

In short:

- A lightweight "auto-reconnect watchdog" that keeps your AllStarLink node linked to designated nodes.

Time and Weather Conditions Announcement

https://github.com/KD5FMU/Time-Weather-Announce

- **Time-Weather-Announce** is a shell-based script package for AllStarLink and Asterisk systems that provides **automated voice announcements of the current time and weather conditions**.
- It retrieves weather data from external sources and converts it into **audio prompts played over a node or repeater**, typically on a scheduled basis (such as top-of-the-hour announcements). (AllStarLink Community Forum)
- The system integrates with standard Asterisk sound files and scripts (like `saytime.pl` and `weather.sh`) to deliver **real-time, configurable spoken updates** for amateur radio users. (AllStarLink Community Forum)

In short:

- A practical "time & weather voice system" for AllStarLink nodes that keeps operators informed with automated, on-air announcements.

Announcement Manager for ASL3

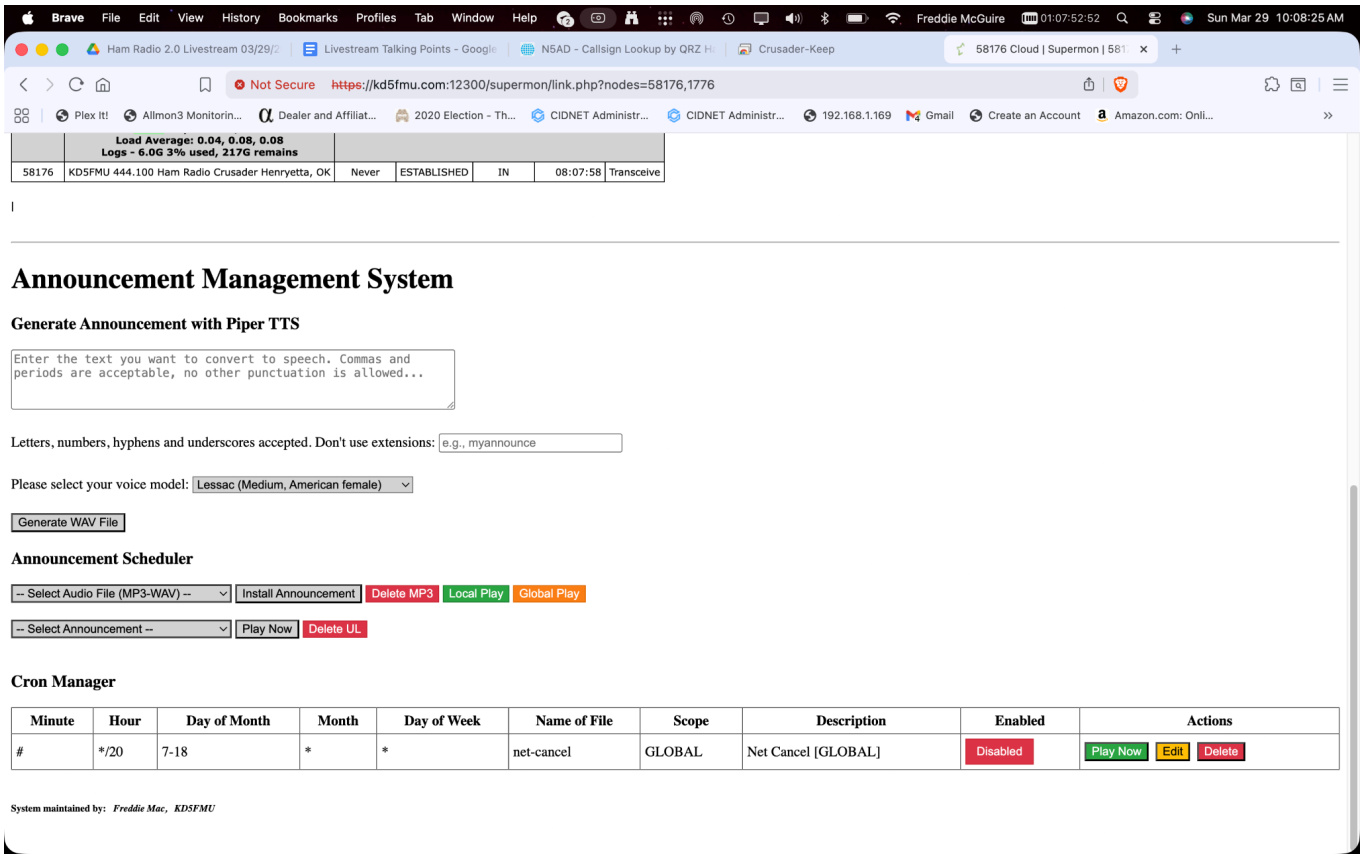
https://github.com/KD5FMU/announcement-manager

Created by James - N5AD

- **announcement-manager** is a script-based tool for AllStarLink Version 3 that enables users to **create, schedule, and manage automated audio announcements** on their nodes.
- It integrates with systems like Supermon and Asterisk to generate **text-to-speech (TTS) or pre-recorded messages** and play them at scheduled intervals. (YouTube)
- The tool simplifies announcement automation by providing a structured way to **schedule recurring messages, alerts, and voice IDs** without complex manual scripting. (YouTube)

In short:

- A centralized "announcement scheduler and manager" that automates voice messaging for AllStarLink nodes.



AllStarLink Multiple Application Install Script

https://github.com/KD5FMU/ASL3_Multi_App_Install

- **ASL3_Multi_App_Install** is a convenience installation script for AllStarLink Version 3 systems that automates the setup of multiple popular applications in one process.
- It installs tools such as **Supermon, AllScan, DVSwitch Server, and Skywarn Plus**, reducing the need for manual configuration. (GitHub)
- Designed for ease of use, the script helps users quickly deploy a fully featured AllStarLink environment with minimal setup time and effort.
- You can pick and choose which applications to install, you may install just one or two or all four at once.

In short:

- A “one-command installer” that streamlines adding essential apps to an AllStarLink v3 node.

Toggle Duplex

https://github.com/KD5FMU/Toggle-Duplex-ASL3

- **Toggle-Duplex-ASL3** is a simple script for AllStarLink Version 3 that allows users to **quickly switch (toggle) the duplex mode** of a node between different operating states.
- It automates changes to node configuration settings, eliminating the need for manual edits to configuration files.
- This is especially useful for operators who need to **dynamically adjust between simplex, half-duplex, or full-duplex operation** during different use cases.
  This works best for me while calling a NET to avoid more of the Courtesy Tone drops.

In short:

- A handy “duplex mode switch” script that makes changing AllStarLink node operation quick and effortless.
